

IRMC

P.C. No.: 167

SUBJECT: Universal Labeling and Procurement of Specimens

Purpose: Laboratory specimens must be collected and labeled in accordance with all regulatory requirements and standards of Clinical Laboratory Improvement Act 1988 (CLIA 88), College of American Pathologists (CAP), Clinical Laboratory Standards Institute (CLSI) and American Association of Blood Banks (AABB). For the safety of patients, the Laboratory cannot accept specimen for testing which have inadequate or discrepant identification.

STANDARD OPERATING PROCEDURES:

- **ALL** specimens must be accompanied by a **requisition**. The **requisition** can be either paper or electronic transmission and must include the following information:
 - Patient's full name:** no nicknames or abbreviations
 - Date of Birth or Medical Record Number**
 - Patient's Location**
 - Name of Ordering Physician**
 - Date and Time of Collection:** on specimen and requisition
 - Collector's initials or Collector's first initial and last name:** collector is person who labels specimen and is responsible for verifying patient identity.
 - Tests Ordered**
 - Anatomic site of specimen for Pathology, Cytology and Microbiology specimens**
 - Urine Source:** Clean catch, cath, bladder
- The person collecting the specimen is responsible for verifying the patient's identification prior to collecting the specimen. The person collecting the specimen must also verify that all computer generated labels match the patient's identification. The person collecting the specimen is responsible for verifying the specimen was collected on the correct patient and that the specimen label is complete, legible, correct and matched with the requisition.
- **ALL** laboratory specimens must be labeled ***IN THE PATIENT'S PRESENCE*** using identifying information from either the patient's wristband or directly from the patient. It is inappropriate to remove the specimens from the patient's presence before they are labeled. If computer generated labels are

not available at time of collection, then the specimens must have hand-written labels before leaving the patient's presence.

- The person who collected the specimen must also label the specimen. It is inappropriate for one person to collect the specimens and give them to another person to apply labels. The only exceptions might be in a code situation, during surgery or an invasive procedure.
- Standard **label requirements** include the following information:
 - Patient name:** Last name, first name (no nicknames or abbreviations)
 - Secondary Identifier:** Such as date of birth or medical record number or account number
 - Date and time of collection**
 - Anatomic site or source** for Pathology and Microbiology specimens
 - Collector's initials**
- Improperly labeled specimens will be considered **UNACCEPTABLE** for analysis and will be rejected if:

Label contains incomplete/incorrect patient name or secondary identifier
Label does not contain a secondary identifier (date of birth or medical record number)

Label is not affixed directly to specimen container or slide (labeling the transport bag is not appropriate)

Label is not legible or labeling on the specimen does not match the information on the requisition or on the electronic order

Label contains misspelled word(s) or when the intention or meaning of the word changes

CLINICAL LABORATORY SPECIMENS

Laboratory personnel will document the time the specimen is received and verify that the labeling and condition of the specimen is acceptable. The information on the label must match the requisition letter-for-letter and number-for-number or it will be considered specimen/label mismatch.

When registering delivered specimens, if the name on the requisition and specimen does not match the full legal name in IRMC's computer system, the name can be verified by cross-referencing the "Other Name" field or calling the patient to verify the legal name.

UNLABELED SPECIMENS or SPECIMEN/REQUISITION MISMATCH:

- Blood and voided urine specimens collected by IRMC employees will be discarded and new specimens collected as soon as possible.
- Blood and voided urine specimens collected by non-employees (Delivered Specimens) generally will not be tested. The physician's office should be contacted BEFORE the specimen is discarded to determine if it is an irretrievable specimen. The specimen may be re-collected by the physician's office or the patient may come to the Outpatient Lab.
- Irretrievable specimens will be considered on a case-by-case basis and approved by the section supervisor. Irretrievable specimens are those specimens that would be difficult to re-collect or where recollection would jeopardize patient care (ex. invasively collected samples, intra-operative samples, timed samples). Irretrievable specimens include, but may not be limited to the following:
 - Body fluids including CSF and amniotic fluid
 - Bone marrow
 - Tissue
 - Stones
 - Gynecology Cytology (pap tests)
 - Culture swabs
 - Non-voided urines (ex. cath, kidney, supra-pubic, etc.)
 - Blood spots
 - Blood or urine specimens on children less than 3 years old
 - Blood or urine specimens that were time sensitive (ex. prior to treatment)
- If an irretrievable specimen is to be tested, a "**Confirmation of Specimen Identification Form**" will be completed and signed by the physician. The person doing Order Entry will enter a chartable footnote into the computer using the template MISLABEL, which indicates that the specimen was received unlabeled/mislabeled and who accepted responsibility for the specimen identification. An Event Report will be completed for Risk Management.
- The "**Confirmation of Specimen Identification Form**" will be forwarded to the section supervisor. Supervisor will review the patient test results and ensure footnotes are attached and Event Reports are completed. The form will then be scanned/filed in the same manner as the requisition.

INCOMPLETELY LABELED or DISCREPANT DATA:

- Blood Bank specimens that are incompletely or incorrectly labeled will be discarded and no testing performed. New specimens should be collected as soon as possible.
- Use of nicknames, misspelled names, incomplete names should be documented on the “**Data Discrepancy Form**”. If the specimen was collected by an IRMC employee, that employee must come to the Lab to correct the data on the specimen or requisition and sign the “Data Discrepancy Form”. If the specimen was collected by a non-employee, the form should be faxed to the physician’s office. Under no circumstances should the specimen be returned to the location where it was collected since this could delay testing or affect the integrity of the specimen.
- Missing or incomplete date, time, collector’s name on the label or requisition may be obtained by phone conversation and documented on the “Data Discrepancy Form.” If the specimen label contains the date, time and collector’s initials, and the requisition is missing this information, the information may be transferred to the requisition.
- The “**Data Discrepancy Form**” will be attached to the requisition and scanned/filed in the same manner as the requisition.

Each Lab Section will maintain a list of acceptable specimen criteria for all tests. If a technologist determines that a specimen is not suitable for analysis, they will initiate a procedure to have the specimen recollected. A QA form is used to document the specimen rejection and recollection.

If a specimen is to be re-collected because of a problem with IV contamination, all tests that were drawn at that time must be re-collected. The tech recollecting the specimen should check in the computer for other tests drawn at the same time.

All specimens for testing must be identified by a unique barcode label that contains the patient’s accession number. Aliquots or poured-off specimens should also have a barcode label that uniquely identifies the specimen for testing.

Capillary specimens that are collected in microtainers must have the patient name and secondary identifier directly on the microtainer. Labeling of only the transport tube is not acceptable. The microtainer may have a handwritten label or a small aliquot barcode label applied. The larger barcode label may be applied to the transport tube in addition to the label on the microtainer.

SPECIMEN LABELING

Placement of computer Generated Labels or Meditech Lab Labels

Note: Each specimen must be labeled with the patient's full name and date of birth (DOB) or MR#, along with the date and time of collection and the collector's initials.

If blood is being drawn or a specimen is being labeled using the **handhelds**, the collector's initials will be printed on the lab label.

When labeling specimens from off sites and outreach areas with Meditech lab label:

- Always verify patient ID by two identifiers: name, DOB, or MR# before placing the lab label.
- The person labeling the specimen must put their initials on the specimen label.
- If a discrepancy is noted from tests listed and tests ordered, contact floor to resolve.
- Place your initials on the lab label.

1. Blood Tubes and pour off tubes

- Hold tube with cap to the left. Place label down the length of the tube.
- Label should be oriented so the last name of the patient is near the cap.
- Do not wrap or spiral the label around the specimen tube. If the label is longer than the tube, then bend the label over the bottom of the tube.
- Place the label so it does not obscure the view of the contents of the tube.

Pour off Tubes (lab use): The person pouring off a specimen must initial the label of the pour off tube.

2. Urine cups, stool containers

- With the specimen cut sitting upright, place the lab label horizontal on the cup.
- Do not put the label on the lid.
- The specimen label should state: source, date/time collected, collector's initials and tests ordered.

3. Microbiology Swabs and Specimens

- Place label lengthwise along the swab with the last name toward the cap.
- Do not wrap or spiral the label around the swab.
- The anatomical site or source must be handwritten on the label.
- Date, time collected, and initials of collector must be on the label.

To label off-site collected swabs with Meditech Labels

- Verify the patient ID, site/source, tests, and match the corresponding Meditech Lab Label with the proper swab.
- Any discrepancy must be resolved by contacting the floor/doctor's office.
- Place Meditech Lab Label on the swab lengthwise with cap to the left, besides the original patient label and information.
- Do not cover the original patient label or information that shows site/source if possible.
- Place your initials on the Meditech lab label. Hold label in place on swab with tape.

4. Blood Culture Bottles

- Verify and match up Blood Culture Bottle Sets:
Aerobic (Blue) + Anaerobic (Purple) = 1 Set
1 Pedi (Pink) bottle = 1 Set
- Watch for identifying draws such as #1, #2, line draw, or peripheral draw.
- Place label lengthwise on the bottle with the neck/stopper to the left.
- Orient the label so the last name of the patient is towards the neck of the bottle.
- Do not cover up the Bactec barcode on the bottle.

Hand-written labels

- The first line on the label will be “LAST NAME, FIRST NAME”. Use the patient’s full name (no nick names or abbreviations)
- The second line will be the patient’s date of birth, or MR number, or account number
- The third line will be the date/time of collection and collectors initials.
- The cap/stopper on the tube should be to the left. (Ex. If you are right handed, hold the cap of the tube with your left hand and write the name of the patient)
- Write directly on the paper label that is attached to the specimen tube. If you are attaching a handwritten label, it must be placed directly on the paper label. The label should be placed down the length of the tube and it should not obscure the contents of the tube.
- For blood culture bottles, DO NOT cover the barcode with the label.

Label example:

Last name, First name		
DOB 1/22/1901		
10/31/07	1530 hrs	collectors initials

BLOOD BANK SPECIMENS – Labeling requirements for Blood Bank are more stringent and must meet AABB standards. All required information ***must*** be on the specimen or the specimen cannot be used.

- Special Blood Bank labels and wristband must be taken to the patient's bedside before attempting to collect the specimen
- Patient name, DOB, MR #, Date and time of collection and collectors ID must be written on the wristband, AND on the label.
- The specimens must be labeled and the wristband must be placed on the patient prior to leaving the patient's presence.

Refer to Attachments for specific instructions:

- [KPS for PDC bands with preprinted labels](#)
- [KPS for Approved Outreach PDC bands \(handwritten\)](#)

ANATOMICAL PATHOLOGY SPECIMENS – includes biopsies, tissues and foreign bodies removed during surgery.

- The label should contain the patient's full name and at least another unique identifier such as date of birth, MR number or account number.
- The initials of the person (circulating/scrub nurse) assisting the physician with specimen collection should be written on the label,
- For Pathology specimens, the exact anatomical site must be written on label.
 - The specimen container should be upright on a counter-top. The label should be attached horizontally to the cup/jar.
 - Do not put the label on the lid of the container since lids are removed during testing.
 - The anatomical site written on the label must exactly match the anatomical site on the requisition.
 - The number of specimens in the jar/cup must match the number of specimens listed on the requisition and label.

Label example for Pathology

Last name, First name	
DOB 1/22/1901	
Bx GEJ	collector's initials

SLIDES OR SMEARS

- Slides must be labeled directly on the frosted end using a pencil. Do not use pen or marker since these will wash off during processing
- Write the Last name, First name and Date of birth
- Only add patient label to the plastic/cardboard slide holder.

Last name
First name
DOB

READ BACK PROCEDURE

When a specimen is obtained during a procedure and passed from one team member to another for preparation, a verbal Read Back is required (for example, from physician to nurse/tech/ etc.).

Steps include:

1. Specimen is passed from physician to a procedural team member.
2. Physician must verbally identify the source of the specimen to the procedural team member(s).
3. The team member(s) restates the specimen source for confirmation from the physician. Clarify spelling with the doctor if needed. Be SPECIFIC when notating the source of the specimen.

Note: In the OR and Endoscopy units, the scrub person keeps an accurate account of the source of each specimen acquired from the physician, keeping them separated until an RN secures them. Each specimen should be identified and marked before the next specimen is obtained.

DOCUMENTATION:

1. Staff will document specimen procurement as per department specific practices.
2. All documentation such as; labels, requisitions, and order entry must be identical.
3. Avoid all spelling errors.

PREPARATION:

1. Please refer to the Labeling instructions above and Specimen Type charts listed below in this policy for specific preparation, ordering and handling.
2. Reference the Endoscopy specific chart and Algorithm for specimens obtained by endoscopy.
3. Ratio of FORMALIN to (routine) SPECIMEN is at least **3 to 1** (ideally 10 to 1).
Use a large enough container to achieve the correct ratio.
4. CYTOLOGY SPECIMEN
 - Reference the cytology specific chart
 - Reference the cytology specific chart
 - Specimens with large volumes of fluid are immediately sent fresh.
 - Small specimens are placed in a falcon tube with 35 ml cystolyt.

SVP for Patient Care Services

SPECIMEN TYPE: ANATOMIC PATHOLOGY to HISTOLOGY DEPARTMENT

<u>Specimen Type:</u>	<u>Preparation:</u>	<u>Computer Order:</u>	<u>Handling:</u>	<u>Key Notes</u>
Routine tissue, bone, and biopsies	Formalin and plastic container then bagged. Formalin is used at a ratio of 3:1, formalin: specimen.	PATH-SP	Sent to Pathology at next scheduled trip/ drop off.	After hours/ weekends to be handled per department specific practice.
Frozen Section	NO formalin in plastic container then bagged. May use telfa with saline to keep specimen moist. Call Pathology, Ext-7167, before the frozen specimen is sent.	PATH-SP	Immediately transported to Pathology, noting the time sent.	Surgeon to schedule all Frozen Sections prior to surgery. Pathologist will call to give report to the surgeon/ surgical team. Note the time of report.
Needle Localization in OR	NO formalin and DOUBLE BAGGED. Call Mammography, Ext- 8081, approximately 15 minutes before sending the specimen.	PATH-SP	Immediately transported to Mammography with pertinent films, noting the time sent. Transporter waits in Mammography and then takes specimen with the pertinent film to Pathology.	Radiologist will read the films and a Radiology Technician will call the OR to give report to the surgical team. Note the time of report.
Fresh	NO formalin in plastic container then bagged. May use telfa with saline to keep specimen moist.	PATH-SP	Immediately transported to Pathology.	Specified by SURGEON for SPECIAL STUDIES. *Kidney stones are ALWAYS sent fresh.*
Amputated Limbs in OR	DRY in a Biohazard labeled, large bag and double bagged.	PATH-SP	Immediately transported to Pathology.	After hours/ weekends immediately transport Labeled and bagged amputated limb to the Morgue. The written Requisition MUST stay in the OR soiled utility workroom and delivered to Pathology at the next scheduled drop off.

*** All specimens, including breast tissue, for pathology must be in a container with formalin. ***
 *** All foreign bodies and hardware with embedded tissue must be sent to Pathology in formalin. ***
 ***Specimens preserved in formalin can be stored at room temperature. ***
 ***All Frozen/ Fresh specimens must be delivered to Pathology STAT. ***

SPECIMEN TYPE: CYTOLOGY to HISTOLOGY DEPARTMENT

<u>Specimen Type:</u>	<u>Preparation:</u>	<u>Computer Order:</u>	<u>Handling:</u>	<u>Key Notes</u>
Cytology Fluid/ Luki Tube	Fresh specimen (No fixative).	PATH-CYTO Only one cytology can be ordered per entry. The time collected must be entered.	Immediately transported to Pathology. Labeling of urine cytologies must include the mode by which it is instrumented Example: Cystoscopic, Bladder, right or left ureter, right or left nephrostomy, or catheterized. Also, voided urine must be labeled as such.	After hours/ weekends, to be handled per department specific practice.
Cytology Slides (Candida)	Immediately spray the specimen on the slide with Cytology Fixative Spray (for slides only). DO NOT let specimen air dry without fixative. Place it into a dry slide holder/ specimen cup.	PATH-CYTO Only one cytology can be ordered per entry. The time collected and number of slides must be entered.	Sent to Pathology at next scheduled trip/ drop off.	
Cytology Brushings	CytoLyt, specimen container, then bagged.	PATH-CYTO Only one cytology can be ordered per entry. The time collected must be entered.	Sent to Pathology at next scheduled trip/ drop off.	
Fine Needle Aspirates	CytoLyt, specimen container, then bagged. May be sent as a fresh specimen during working hours.	PATH-FNA	Sent to Pathology at next scheduled trip/ drop off.	
PAP tests	Collected by physician. Collect thin Prep Kits available in Lab.	PATH-PAP	Sent to Pathology at next scheduled trip/ drop off.	

*****ALL SHARED Cytology Specimens between Pathology and Microbiology must ALWAYS be sent FRESH and directed to Microbiology FIRST.*****
*****Microbiology specimens are to be dropped off at the Central Lab Window (Specimen Processing Area) of the Laboratory.*****

SPECIMEN TYPE: MICROBIOLOGY to the CENTRAL LAB WINDOW
(Specimen Processing Area)

<u>Specimen Type:</u>	<u>Preparation:</u>	<u>Computer Order:</u>	
Tissue, bone and biopsies for Culture	Fresh specimen, use sterile cup or sterile culturette	Culture (tissue, bone, wound)	MIC-CWC
		Fungal Culture	MIC-CFUNG
		AFB Culture	MIC-CAFB
		Gram Stain	MIC-GS
Brushings for Microbiology	Brush <i>only</i> , in Sterile cup.	Brushings – Microbrush	MIC-CMICB
Luki Tube for Microbiology	Fresh specimen, use sterile cup or sterile tube	Sputum Culture	MIC-CSPUT
		Washings for Culture – Bronch wash	MIC-CBAL
Stool/ Aspirate specimens for Culture, Gram Stain, Giardia Crypto Antigen, Whites, and C. Diff	Fresh specimen use sterile cup or aspirate container.	Stool Culture	MIC-CST
		Clostridium Toxin	LAB-CTPCR
		Giardia Crypto Antigen	MIC-OP
		Stool for Whites	LAB-STWB
<u>Handling:</u>	Deliver to the Central Lab Window (Specimen Processing Area) in the Lab.		
<u>Key Notes:</u>	Deliver ALL Microbiology specimens as soon as possible. Never keep overnight.		

ALL Microbiology specimens are FRESH; NEVER use fixative.

ALL specimens for Microbiology should be placed in sterile containers.

ALL SHARED specimens between Microbiology and Pathology (cytologies) must be designated on the label as SHARED.

ALL SHARED specimens must be sent to Microbiology *FIRST*.

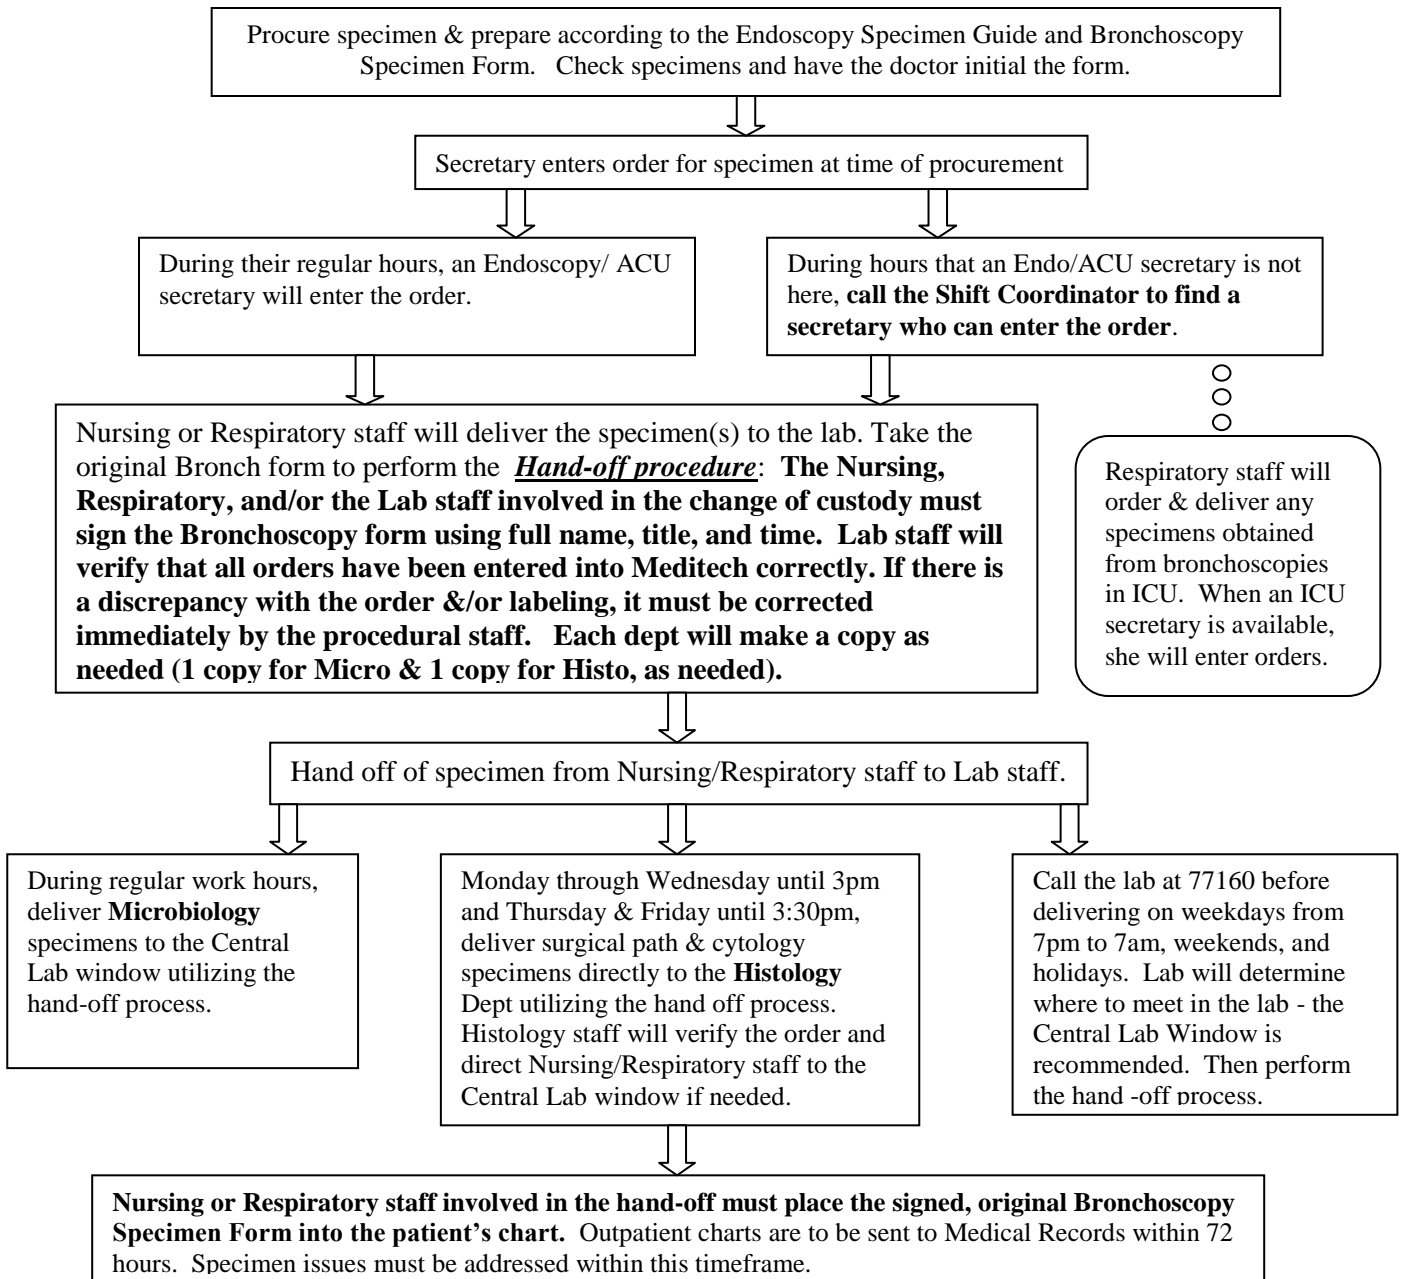

ALL Microbiology specimens MUST have a *TIME* specified on the label.

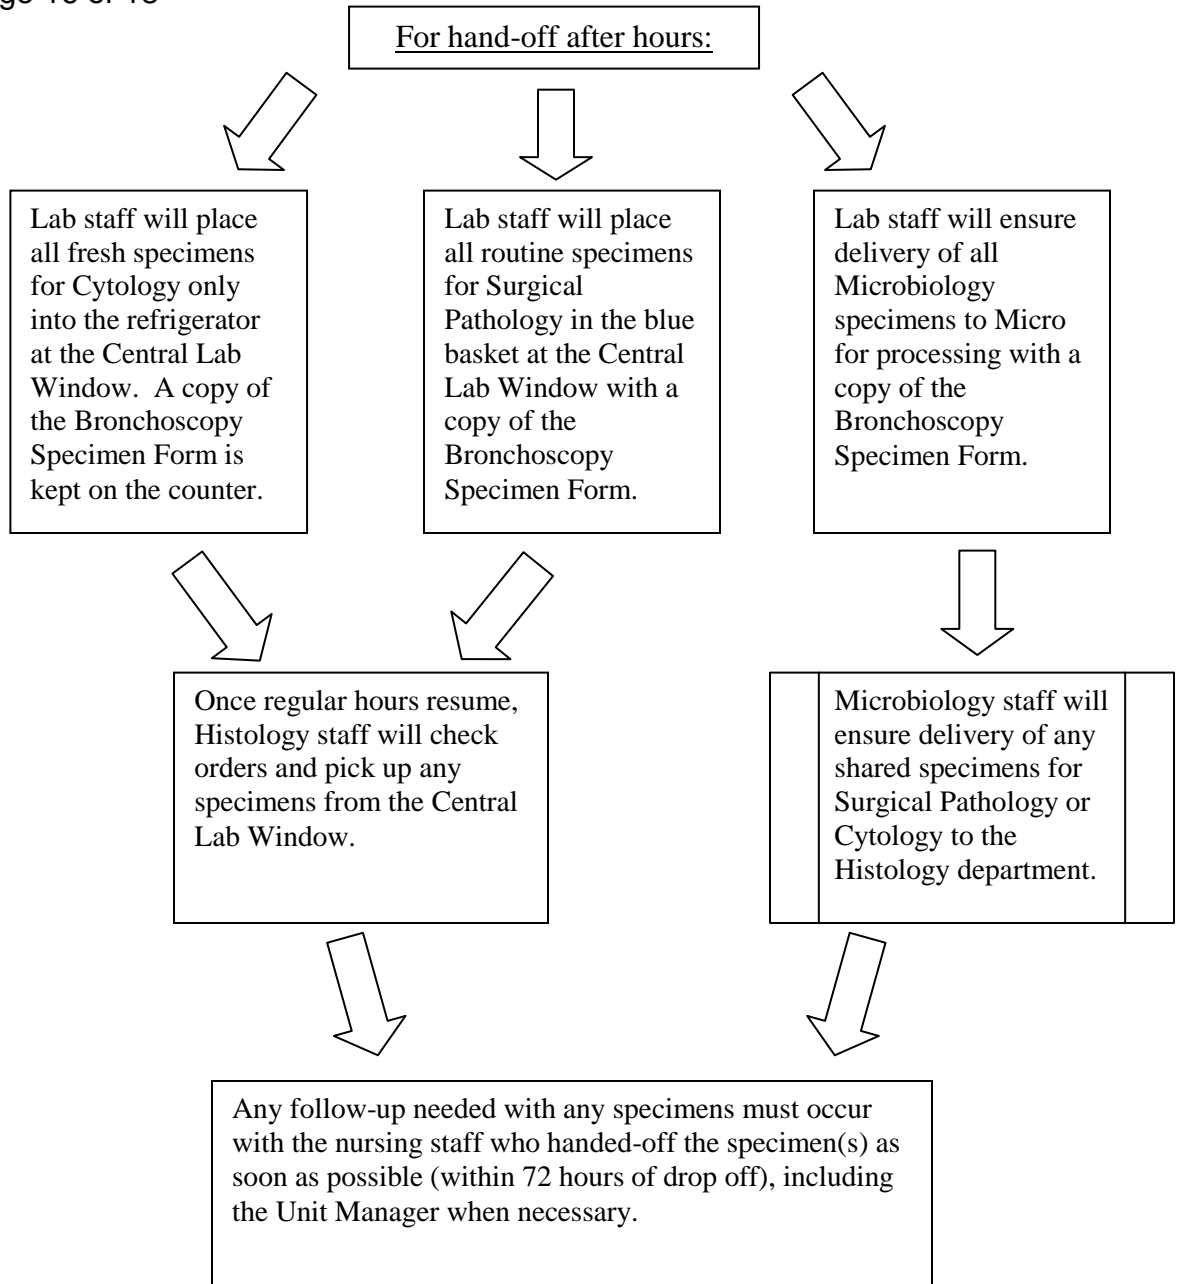

ENDOSCOPY SPECIFIC CHART

	Specimen Type	Order Computer	in Preparation	Delivery to	After Hours & Key Notes	
HISTOLOGY	SURGICAL PATHOLOGY	Frozen Sections & Touch Prep- for immediate diagnosis	PATH-SP Place next to specimen name- "for FROZEN"	Fresh (NO FIXATIVE) Plastic container & lid NSS- small amount to keep tissue moist on telfa or gauze	Histology- STAT	The Pathologist will call the surgeon with report immediately after examining specimen.
		Routine specimens: Tissue, bone and biopsies for pathology; including Needle Biopsies (For Example: Transbronchial Biopsy)	PATH-SP	Plastic container & lid Always add 10% Formalin Ratio 3:1, (10:1 is ideal) = Formalin: specimen	Histology Approximate drop off times: 0730, 1030, 1300 with last delivery at 1500 on Monday through Wednesday and 1515 on Thursday and Friday.	After hours, weekends, and holidays routine specimens can be kept on the nursing unit if there are no other types of specimens to go to lab. Deliver routine specimens to the Lab's Central Window when fresh specimens are also obtained.
	CYTOLOGY	Luki tube/fluid for Cytology (includes Differential)	PATH-CYTO	Fresh	Histology Deliver fresh specimens to Histo immediately- within 1 hour of procurement.	All shared specimens must be delivered fresh immediately, to Microbiology first. DO NOT put Cytolyt or Formalin on the specimen. Microbiology staff will send the specimen to Histology if it is to be shared. Note on the label of a shared specimen: "SHARED" . Call the lab at 77160 before delivering fresh cytologies on weekdays between 7pm to 7am, weekends, and holidays. At the Lab's Central Window utilize the hand-off process and the Lab personnel will place the specimen in the correct refrigerator.
		Brushings for Cytology & ERCP Stents	PATH-CYTO	Place brush or stent in CytoLyt Ensure CytoLyt completely covers brush/stent.	Always perform hand-off process with lab personnel outlined in policy. Cytolyt to specimen- Ratio 1:3 = CytoLyt: specimen	
		Slides for Cytology: Slides made during brushings and Candida slides	PATH-CYTO Label the slide on frosted end with a pencil : Full patient name & source.	Use Cytology Fixative Spray immediately after collection (saturate cells). DO NOT let slide air dry before spraying. Place into slide container.	Gently swish the fluid around to ensure CytoLyt is covering entire specimen.	
		Fine Needle Aspirate: (For example: Transbronchial Needle Aspirate (TBNA))	PATH-FNA (For cells and/or fluid)	Always add CytoLyt CytoLyt instructions in next box to the right.		
	MICROBIOLOGY No Fixative	Tissue, bone and biopsies for culture	MIC- enter specific orders whether for Culture, gram stain, fungus, etc.	Fresh Sterile cup or culturette Never use Formalin or CytoLyt	Lab - <u>Central Lab window</u> Deliver ALL Microbiology specimens immediately - within 1 hour of procurement. Perform the hand-off process outlined in policy.	Never keep microbiology specimens overnight. All shared specimens must be delivered fresh immediately, to Microbiology first. DO NOT put Cytolyt or Formalin on the specimen. Microbiology staff will send the specimen to Histology if it is to be shared. Note on the label of a shared specimen: "SHARED" . Call the lab at 77160 before delivering on weekdays between 7pm to 7am, weekends, and holidays. Lab personnel will determine where to meet in the lab for hand-off.
Brushings for Microbiology		MIC- enter orders as specified by doctor	Fresh Place brush in sterile cup Never use Formalin or CytoLyt			
Slides for Microbiology (Gram Stain)		MIC- enter orders as specified by doctor	DO NOT spray, Air dry the slide Label the slide on frosted end with a pencil : Full patient name & source. Place into slide container or cup.			
Stool/ aspirate specimens for Microbiology- culture, gram stain, giardia crypto antigen, whites, C.diff		MIC- enter orders as specified by doctor LAB- enter CTPCR, OP, STWB**	Fresh Sterile cup or aspirate container			
Luki tube for Microbiology		MIC- enter orders as specified by doctor	Fresh			
** CT= Clostridium Toxin (C.diff), OP= Giardia Crypto Antigen, STWB= Stool for Whites						

Endoscopy Procedures Performed Outside of the Endoscopy Unit:				
	Documents Case	Enters Charges	Owns Specimen	Key Notes
By Endoscopy staff in the ICU or Radiology Dept	Endoscopy RN	Endoscopy staff	Endoscopy staff	After hours, fresh specimens will be processed by an ICU/float secretary with the Endo staff
By ICU staff in the ICU	ICU RN	ICU staff	ICU staff	Endo staff will be called in to clean/process the scope used
By OR & Endo staff in the OR	OR RN	OR staff, Endo staff will charge supplies from Endo Dept	OR staff	Endo staff will assist OR staff with the specimen handling/processing
